Modelling Agroforestry Systems - CATIE

The concept of agroforestry is not new and is in practice for quite a long time. It is the integrated and self-sustained land management system that involves the growing of agricultural crops deliberately

along with the trees or woody components. It may also include rearing of livestock along with cropping of trees.

An Introduction and Benefits of Agroforestry

Inspired by nature, Regenerative Agroforestry is a cultivation system that merges trees and agriculture (crops or

livestock). All these different elements complement each other. This leads to enhanced resilience, increased biodiversity and a more productive, profitable, and climate-friendly use of the land compared to a monoculture system.

Agroforestry is a dynamic, ecologically-based, natural resource management system that, through the integration of trees into farms, diversifies and sustains smallholder production for increased social, economic, and environmental benefits (Leaky 1996).

Agroforestry Models for Promoting Effective Risk ...

This intentional act of combining agriculture and forestry to create integrated and sustainable land-use systems is called agroforestry. While this concept may be new to many, agroforestry as a system is relatively

old, existing in many parts of the world.

Introduction to Agroforestry - Forest*A*Syst

The principles behind agroforestry are not new, they have been practised for as long as humans have been farming. Realising the full potential of integrating commercially managed trees into

farming systems is, however, still a long way off. This book introduces the theory of agroforestry. We look at practical management and design considerations.

Agroforestry systems based upon ecological models present a middle

ground between resource conservation and economic productivity. Short-term, mid-term, and long-term crops can be planned into a system to provide both immediate sources of revenue as well as to support the long-term economic stability of a small farm enterprise.
