XML documents must contain a root element. This element is "the parent" of all other elements. The elements in an XML document form a document tree. The tree starts at the root and branches to the lowest level of the tree. All elements can have sub elements (child elements).

XML Example - javatpoint

XML per se is great. My slightly-technically-inclined client can far more easily look at an XML document and understand its tree structure (especially when pretty-printed) than they can make out anything useful from a CSV file. And it adds, of course, a proper hierarchy. The extensibility of XML — with namespaces — is kind of messy.
